American Sign Language (ASL) recognition model

Real-time ASL recognition • camera → model → text

Turn hands into letters in the moment

This is a project that watches a frame, makes a guess, and shows you what the model thinks. No grand promises, just a clean pipeline you can iterate on. 99% Accuracy.

webcam capturebase64 → FlaskPyTorch inferenceinstant feedback loop

Quick tips

Keep your hand inside the frame, hold still for a beat, and aim for even lighting. If the output looks off, try moving slightly closer to the camera.

Live camera read

Grab one frame and ask the model to name the sign.

camera: ready

Archive pull

Roll a random dataset image and see how the model behaves outside the webcam feed.

random sample

Roll a sample R

No sample loaded yet. Hit R to pull one.

MODEL SAYSlabel: /random

127.0.0.1

done

Live camera read

Grab one frame and ask the model to name the sign.

camera: ready

Snap & readSpaceMirror

MODEL OUTPUTB

Try the same sign again with a different angle or distance.

Archive pull

Roll a random dataset image and see how the model behaves outside the webcam feed.

random sample

Roll a sample R

MODEL SAYSlabel: B /random

What this is: An interface for experimenting with ASL classification. One frame in, one prediction out.

Why it matters: Tools like this can become building blocks for learning aids, accessibility demos, and human-in-the-loop dataset cleanup.
